

Statistical genetics and complex psychiatric phenotypes, especially major depression

Prof. Bertram Mueller-Myhsok
(Max Planck Institute of Psychiatry, Munich) 03/07/2009.

The unravelling of the genetics of complex phenotypes has in recent years, for some phenotypes, been very successful due to whole-genome analyses. Other phenotypes, such as major depression, have seen less success. I will present our own data on aspects of genetics of major depression, including some efforts to tackle the computational complexity of whole-genome analysis of epistasis.
