Genetics

Molecular biology

Bioinformatics

2 Evolving trends in bioinformatics

Challenges

Topics in bioinformatics from a journal’s perspective

3 Bioinformatics software

R and Bioconductor
1 Bioinformatics – what’s in a name?

Genetics

- Genetics is the study of how traits such as hair color, eye color, and risk for disease are passed ("inherited") from parents to their children. Genetics influence how these inherited traits can be different from person to person.
- Your genetic information is called your genetic code or genome.

Your genome is made up of a chemical called deoxyribonucleic acid (DNA) and is stored in almost every cell in your body.
Molecular biology

(adapted from: Davies et al 2009, Integrative genomics and functional explanation)
Epigenetics – could the central dogma be in danger?

If parents are able to pass environmental information, in the form of epigenetic modifications, on to their offspring as well as their genetic code, epigenetic inheritance adds a whole new dimension to the modern picture of evolution. For over a hundred years we have accepted that the genetic code changes slowly, through the processes of random mutation and natural selection. Epigenetics creates the possibility for a much more rapid response to signals from the environment. It requires a completely different concept of information transfer – experiences had generations ago, such as a famine during your grandmothers time, could influence the way that your body develops, even in today’s more plentiful western world.

Computational biology

- Biology = noun
- Computational = adjective

*When I use my method (or those of others) to answer a biological question, I am doing science. I am learning new biology. The criteria for success has little to do with the computational tools that I use, and is all about whether the new biology is true and has been validated appropriately and to the standards of evidence expected among the biological community. The papers that result report new biological knowledge and are science papers. This is computational biology.*

(https://rbaltman.wordpress.com)

*Computational biology = the study of biology using computational techniques. The goal is to learn new biology, knowledge about living sytems. It is about science.*
Bioinformatics

- Bio(logy) + Informatics (2 nouns)

When I build a method (usually as software, and with my staff, students, post-docs—I never unfortunately do it myself anymore), I am engaging in an engineering activity: I design it to have certain performance characteristics, I build it using best engineering practices, I validate that it performs as I intended, and I create it to solve not just a single problem, but a class of similar problems that all should be solvable with the software. I then write papers about the method, and these are engineering papers. This is bioinformatics. (https://rbaltman.wordpress.com)

Bioinformatics = the creation of tools (algorithms, databases) that solve problems. The goal is to build useful tools that work on biological data. It is about engineering.
Genetic epidemiology

- Genetic epidemiology is a particular sub-discipline of epidemiology which considers genetic influences on human traits.
- As with any other epidemiologic studies, genetic epidemiology studies aim
  - to assess the public health importance of diseases,
  - to identify the populations at risk,
  - to identify the causes of the disease,
  - and to evaluate potential treatment or prevention strategies based on those findings
- Strategies of analysis include population studies and family studies.
  - Huge challenge is to combine big data repositories from population or family-studies (e.g., genomics, transcriptomics, metagenomics, metabolomics, epigenomics, ....) with clinical and demographic data:
  
  **BIOINFORMATICS**
Integration with high-throughput omics (data-bases)

Janet Thornton, EBI
2 Evolving trends in bioinformatics

Challenges in bioinformatics

- Data deluge (availability, what to archive and what not?, ...)
- Knowledge management (accessibility, usability, ...)
- Predicting, not just explaining (what comes first: hypothesis generation, data collection? ...)
- Precision medicine (alias: personalized medicine; holistic approach – correlating different causal associations – versus a reductionist approach – targeting very specific biomarkers, negative gold standards ... negative controls)
- Speciation (loss in biodiversity, evolutionary units, “integrative taxonomy”: molecular, morphological, ecological and environmental information)
- Inferring the tree of life (unresolved orthology assignment, gene sampling pyramid)
Topics in bioinformatics from a journal’s perspective

(source: Scope of the journal “Bioinformatics”)

Data and Text Mining
This category includes: New methods and tools for extracting biological information from text, databases and other sources of information. Description of tools to organize, distribute and represent this information. New methods for inferring and predicting biological features based on the extracted information. The submission of databases and repositories of annotated text, computational tools and general methodology for the work in this area are encouraged, provided that they have been previously tested.
The journal ....

*BioData Mining* is an open access, peer reviewed, online journal encompassing research on all aspects of data mining applied to high-dimensional biological and biomedical data, focusing on computational aspects of knowledge discovery from large-scale genetic, transcriptomic, genomic, proteomic, and metabolomic data.

Topical areas include, but are not limited to:

- Development, evaluation, and application of novel data mining and machine learning algorithms.
- Adaptation, evaluation, and application of traditional data mining and machine learning algorithms.
- Open-source software for the application of data mining and machine learning algorithms.
- Design, development and integration of databases, software and web services for the storage, management, retrieval, and analysis of data from large scale studies.
- Pre-processing, post-processing, modeling, and interpretation of data mining and machine learning results for biological interpretation and knowledge discovery.
Databases and Ontologies

This category includes: Curated biological databases, data warehouses, eScience, web services, database integration, biologically-relevant ontologies.
Bioimage Informatics
This category includes novel methods for the acquisition, analysis and modeling of images produced by modern microscopy, with an emphasis on the application of innovative computational methods to solve challenging and significant biological problems at the molecular, sub-cellular, cellular, and tissue levels.

This category also encourages large-scale image informatics methods/applications/software, joint analysis of multiple heterogeneous datasets that include images as a component, and development of bioimage-related ontologies and image retrieval methods.
Genetics and Population Analysis
This category includes: Segregation analysis, linkage analysis, association analysis, map construction, population simulation, haplotyping, linkage disequilibrium, pedigree drawing, marker discovery, power calculation, genotype calling.
**Genome analysis**

This category includes: Comparative genomics, genome assembly, genome and chromosome annotation, identification of genomic features such as genes, splice sites and promoters.
Sequence analysis
This category includes:
Multiple sequence alignment, sequence searches and clustering; prediction of function and localisation; novel domains and motifs; prediction of protein, RNA and DNA functional sites and other sequence features.
Phylogenetics

This category includes: novel phylogeny estimation procedures for molecular data including nucleotide sequence data, amino acid data, whole genomes, SNPs, etc., simultaneous multiple sequence alignment and phylogeny estimation, phylogenetic approaches for any aspect of molecular sequence analysis (see Sequence Analysis scope), models of molecular evolution, assessments of statistical support of resulting phylogenetic estimates, comparative methods, coalescent theory, approaches for comparing phylogenetic trees, methods for testing and/or mapping character change along a phylogeny.
Gene Expression
This category includes a wide range of applications relevant to the high-throughput analysis of expression of biological quantities, including microarrays (nucleic acid, protein, array CGH, genome tiling, and other arrays), RNA-seq, proteomics and mass spectrometry. Approaches to data analysis to be considered include statistical analysis of differential gene expression; expression-based classifiers; methods to determine or describe regulatory networks; pathway analysis; ...
**Systems Biology**

This category includes whole cell approaches to molecular biology. Any combination of experimentally collected whole cell systems, pathways or signaling cascades on RNA, proteins, genomes or metabolites that advances the understanding of molecular biology or molecular medicine will be considered. Interactions and binding within or between any of the categories will be considered including protein interaction networks, regulatory networks, metabolic and signaling pathways. Detailed analysis of the biological properties of the systems are of particular interest.

About Bioconductor

Bioconductor provides tools for the analysis and comprehension of high-throughput genomic data. Bioconductor uses the R statistical programming language, and is open source and open development. It has two releases each year, 1024 software packages, and an active user community. Bioconductor is also available as an AMI (Amazon Machine Image) and a series of Docker images.

News

- Bioconductor F1000 Research Channel launched.
- Bioconductor 3.1 is available.
- Orchestrating high-throughput genomic analysis with Biocductor (abstract) and other recent literature.

Install »

Get started with Bioconductor

R (TA- sessions)

- R is a freely available language and environment for statistical computing and graphics which provides a wide variety of statistical and graphical techniques: linear and nonlinear modelling, statistical tests, time series analysis, classification, clustering, etc.
  - Consult the R project homepage for further information.
  - The “R-community” is very responsive in addressing practical questions with the software (but consult the FAQ pages first!)
- CRAN is a network of ftp and web servers around the world that store identical, up-to-date, versions of code and documentation for R.
The R Project for Statistical Computing

Getting Started

R is a free software environment for statistical computing and graphics. It compiles and runs on a wide variety of UNIX platforms, Windows and MacOS. To download R, please choose your preferred CRAN mirror.

If you have questions about R like how to download and install the software, or what the license terms are, please read our answers to frequently asked questions before you send an email.

News

- R version 3.2.2 (Fire Safety) has been released on 2015-08-14.
- The R Journal Volume 7/1 is available.
- R version 3.1.3 (Smooth Sidewalk) has been released on 2015-03-09.
- useR! 2015, will take place at the University of Aalborg, Denmark, June 30 - July 3, 2015.
- useR! 2014, took place at the University of California, Los Angeles, USA June 30 - July 3, 2014.
