#### Center for Electric Power and Energy (CEE) Department of Electrical Engineering

- CEE established 15 August 2012 as a merger of existing units:
  - Center for Electric Technology, DTU Electrical Engineering
  - Intelligent Energy Systems, Risø National Laboratory for Sustainable Energy
- Main competences
  - Electric Power Engineering
  - Automation and control
  - Information and Communication Technology
- A strong university center within its field
  - Staff: 85 persons incl. PhD-students
  - Covers discipline oriented research as well as national lab type applicationdriven research and proof-of-concept
- Strategic partnerships

# Research Challenges

2012

# Danish Government Energy Target towards 2050

ORES ENERCI

#### Regeringens energipolitiske milepæle frem mod 2050

For at sikre, at vi opnår 100 pct. vedvarende energi i 2050, har regeringen en række energipolitiske milepæle i årene 2020, 2030 og 2035. Disse målsætninger er hver især skridt i den rigtige retning, der sikrer fremdrift mod 2050.

2020 Halvdelen af det traditionelle elforbrug er dækket af vind	2030 Kul udfases fra danske kraftværker Oliefyr udfases	2035 El- og varmeforsynin- gen dækkes af vedva- rende energi	2050 Hele energiforsyningen – el, varme, industri og transport – dækkes af vedvarende energi	
Initiativerne frem til 202 i forhold til 1990	20 resulterer i en reduktion	af drivhusgasudledningerr	ne på 35 pct.	
50% wind in the electricity system	No coal	100% RE in electricity and heating systems	100% RE (incl. transport and industry)	
		< D > < D	→ < E → < E → E	うく

## Future Challenges:

Secure Operation of Sustainable Electric Power Systems

#### • Future visions: a society with minimal dependency of fossil fuels

- Requires power production to be mainly based on renewable energy sources (RES)
- Production becomes subject to prevailing weather conditions

< ロト < 同ト < ヨト < ヨ

## Future Challenges:

Secure Operation of Sustainable Electric Power Systems

- Future visions: a society with minimal dependency of fossil fuels
  - Requires power production to be mainly based on renewable energy sources (RES)
  - Production becomes subject to prevailing weather conditions
- The challenge of maintaining balance between production and consumption has received significant research focus
  - Demand as a frequency controlled reserve
  - Utilize controllable loads (EVs, heat pumps, etc.)

#### Introduction

### Advancing Power System Protection and Control

• Traditionally, power system protection and control has been based on local measurements

During critical operating conditions, the control and protection equipment can have negative effect on the system stability and directly contribute to the process leading to a system blackout.

• Wide area measurement can be used to identify critical operating conditions and use that information to change control and protection parameters to avoid large scale blackout

### The SOSPO Project - Objective

Secure Operation of Sustainable Power Systems

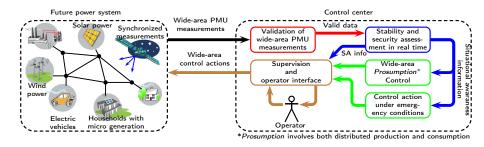

• The SOSPO project aims to solve critical, difficult and not yet treated problems in relation to the operation of future power systems:

How to ensure a secure operation of the future power system where the operating point heavily is fluctuating?

#### **Project Objective**

### Early Warning Against Emerging Blackouts

Element-wise assessment of stability

- Element-wise assessment of a particular mechanism of instability
  - Individual assessment of each relevant system element (a generator or a node)
  - Focussing on an assessment of one particular stability mechanism
  - The system model is reduced such that only factors that have a significant influence on the stability mechanism are included
  - Possibility for assessment times suitable for real-time operation

26-04-2013 25 / 39

イロト イポト イヨト イヨト

### Early Warning Against Emerging Blackouts

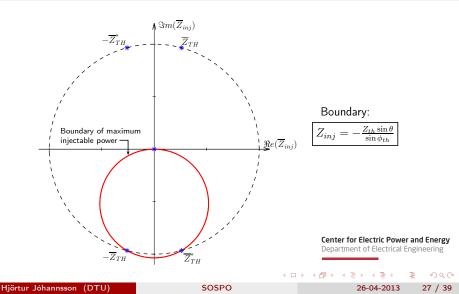

Element-Wise Assessment of Stability

- Category: Aperiodic small-signal rotor angle stability
- Mechanism: Steady state torque balance in each generator  $G_i$
- Boundaries: Maximum steady-state injectable power from  $G_i$
- The stability can be assessed if  $\overline{Z}_{inj}$  and  $\overline{Z}_{th}$  are known

### Early Warning Against Emerging Blackouts

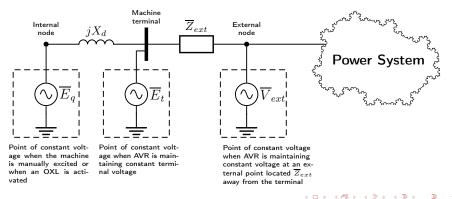

Assessment of Aperiodic Small Signal Stability - Stability Boundary

### Early Warning Method

Assessment of Aperiodic Small Signal Stability: Generator Representation

- The synchronous machines have to be appropriately represented when the assessment is carried out
- This includes that excitation control and protection (AVR and OXL) have to be considered

26-04-2013

28 / 39

Normalizing Multiple Operating Points

• The method performs an element-wise assessment of the generators stability by utilizing their operating points  $\{\overline{Z}_{inj,i}, \overline{Z}_{th,i}\}$ 

Normalizing Multiple Operating Points

- The method performs an element-wise assessment of the generators stability by utilizing their operating points  $\{\overline{Z}_{inj,i}, \overline{Z}_{th,i}\}$
- In a system with k generators, k Thevenin impedances  $\overline{Z}_{th,i}$  are determined resulting in k different stability boundaries
  - The boundaries are circular can be normalized as a unit circle
  - All of the k operating points can be visualized in the same normalized injection impedance and held against the same stability boundary

(日) (周) (日) (日) (日) (日)

Normalizing Multiple Operating Points
